Application - Software Engineer

Dear Julius Schilling,

I am applying for the Software Engineer position at sizeless.

What interests me about sizeless is the connection between field capture and usable documentation: turning smartphone recordings into 3D models and results that fit CAD and GIS workflows. That requires computer vision, applications and infrastructure to work together, and building those connections is what I enjoy.

At Aptar, I worked on a computer vision proof of concept for the marketing team. I automated synthetic dataset generation with Python and Blender, trained a YOLO model, and developed applications for web, mobile and Apple Vision Pro that worked online and offline. My bachelor's thesis also focused on computer vision and mixed reality for product prototyping with Apple Vision Pro. This gave me experience across the path from data and model development to the application that makes the result useful.

At Netsons, I develop PHP and JavaScript web services, work with the systems team on application and infrastructure integration, and automate releases with CI/CD and Docker. I use Codex and Claude Code, studying model capabilities and limitations to choose the context and workflow suited to each task.

In personal projects, I extend Hermes with Python modules for specialist agents, memory and task automation. I integrate voice and telephony through LiveKit/SIP and tools through MCP, with authorization controls and persistent request handling. Building these integrations and managing their infrastructure has taught me to consider state, failures and recovery alongside individual components.

I am pursuing a master's degree in Computer Engineering at Politecnico di Torino, on the Computing and Network Infrastructures track. Competing internationally in dance, with 17 Italian titles, has strengthened my ability to work consistently, handle pressure and use feedback to improve.

I would contribute across capture, backend and workspace features, building integrations and internal tools with attention to how data moves between components. I bring hands-on computer vision experience alongside application and infrastructure development: a combination that can help turn model capabilities into a usable product.

I would welcome the chance to walk you through these projects and discuss where I could contribute to SiteScan and your platform. Thank you for considering my application.

Kind regards,

Marco D'Antonio
