Application - Software Developer

Dear Hiring Team,

I am applying for the Software Developer position at Example company - layout preview.

This demonstration letter is a layout preview. In a real application, this paragraph explains why I am interested in the company and connects a requirement from the job description to a concrete example from my experience.

At Netsons, I develop web services and connect applications with infrastructure, working alongside the systems team. I automate releases with CI/CD and Docker and use Codex and Claude Code, studying model capabilities and limitations to choose an approach suited to each problem.

In my personal projects, I develop Python extensions for Hermes, including specialist agents, memory and task automation. I integrate voice and telephony with LiveKit/SIP and tools through MCP, with authorization controls and persistent request handling. I also manage self-hosted infrastructure with virtualization, ZFS storage and integrated services.

Alongside my work, I am pursuing a master’s degree in Computer Engineering at Politecnico di Torino and competing internationally in dance, with 17 Italian titles. This experience has strengthened my ability to plan, collaborate and remain focused under pressure.

In a real letter, this paragraph explains the concrete contribution I could make to the role, supported by the experiences above. This is a format demonstration, not a submitted application.

I would welcome the opportunity to discuss how these experiences could contribute to your team. Thank you for considering my application.

Kind regards,

Marco D’Antonio
